

## How To Disable Firewall on RHEL / CentOS / RedHat Linux

**iptables** is administration tool / command for IPv4 packet filtering and NAT. You need to use the following tools:

[a] **service** is a command to run a System V init script. It is use to save / stop / start firewall service.

[b] **chkconfig** command is used to update and queries runlevel information for system service. It is a system tool for maintaining the /etc/rc\*.d hierarchy. Use this tool to disable firewall service at boot time.

### How Do I Disable Firewall?

First login as the root user.

Next enter the following three commands to disable firewall.

```
# service iptables save
```

```
# service iptables stop
```

```
# chkconfig iptables off
```

If you are using IPv6 firewall, enter:

```
# service ip6tables save
```

```
# service ip6tables stop
```

```
# chkconfig ip6tables off
```
