

## How to install IonCube loader on CentOS 6.3

### Download and uncompress the latest IonCube version:

```
# wget http://downloads2.ioncube.com/loader_downloads/ioncube_loaders_lin_x86-64.tar.gz
# tar xvfz ioncube_loaders_lin_x86-64.tar.gz
```

### Then we go to the new IonCube source directory:

```
# cd ioncube/
```

### Move ioncube\_loader\_lin\_5.3.so:

```
# mv ioncube_loader_lin_5.3.so /usr/lib64/php/modules
```

### Now edit /etc/php.ini and add the line zend\_extension = /usr/lib64/php/modules/ioncube\_loader\_lin\_5.3.so right at the beginning:

```
# vi /etc/php.ini
[PHP]
zend_extension = /usr/lib64/php/modules/ioncube_loader_lin_5.3.so
```

### Now restart Apache:

```
# /etc/init.d/httpd restart
```

### You can test by creating a small PHP file

```
# vi /var/www/html/info.php
```

### Now we call that file in a browser (e.g. [http://\\*\\*\\*your website\\*\\*\\*/info.php](http://***your website***/info.php))

If its not showing you might have to disable SELinux;

```
# vi /etc/selinux/config
```

### All Done!
