

Install Dell OpenManage 7.4 on XenServer 6.5

1.

Login to your console through SSH like `ssh root@YOUR-XEN-SERVER-IP`

2.

Add the Dell repository

To do this run this command:

```
wget -q -O - http://linux.dell.com/repo/hardware/latest/bootstrap.cgi | bash
```

3.

Install lockfile

OpenManage needs a binary called 'lockfile' which can be found in the 'procmail' package and seems to be working. Execute these commands to install the binary:

```
yum --enablerepo=base --disablerepo=citrix install procmail
```

```
cp /usr/bin/lockfile /tmp/
```

```
yum remove procmail
```

```
mv /tmp/lockfile /usr/bin/lockfile
```

4.

Install srvadmin-all

To install the OpenManage software run this command:

```
yum --enablerepo=base --disablerepo=citrix install srvadmin-all
```

5.

Add a firewall rule

Before we can access the web-interface we need to add a rule to the firewall and restart iptables:

```
vi /etc/sysconfig/iptables
```

Add this line before the REJECT line at the bottom:

```
-A RH-Firewall-1-INPUT -m state --state NEW -m tcp -p tcp --dport 1311 -j ACCEPT
```

Restart iptables:

```
service iptables restart
```

Start the services

6.

To start the services run this command:

```
/opt/dell/srvadmin/sbin/srvadmin-services.sh start
```

7.

Access the web-interface

To access the web-interface open your browser (IE, Firefox or Safari, chrome doesn't work) and go to:

<https://YOUR-XEN-SERVER-IP:1311/>

You can now login with your XenServer root login and password.
